Foreword

Purchase orders are the basis of almost all business processes, either for ordering a product, item, raw materials or service. The purchase order process is a fundamental component of efficient and accountable business operations. It contributes to cost control, accurate record-keeping, supplier relationships, and overall financial health, making it economically relevant for businesses of all sizes and industries. Because demand for products is the starting point for purchase orders and thus the production of goods, they play a crucial role in the value chain.

This document describes the specification of AAS Submodel Purchase Request Response as a part of a set of three Submodels (Purchase Request Notification, Purchase Request Response, Purchase Order Creation) to depict the purchase order process from request to order completion in the Asset Administration Shell.

These Submodels close the gap between existing standard formats for describing process orders and Industry 4.0 standards to support interoperability between these standards and the AAS of the items (assets) which are the subject of the purchase orders.

The Submodel Purchase Request Response aims to provide a standardized property structure for purchase requests responses (quotations) made by a seller / supplier to a buyer / customer.

The Submodel has been developed in the joint-project InterOpera by a working group of industrial and scientific specialists with different roles related to predictive maintenance. The members of the working group are listed in authors caption on page 2.

1 General

1.1 About this document

This document is a part of a specification series. Each part specifies the contents of a Submodel template for the Asset Administration Shell (AAS). The AAS is described in [1-3] and [6]. First exemplary Submodel contents were described in [4], while the actual format of this document was derived by the "Administration Shell in Practice" [5]. The format aims to be very concise, giving only minimal necessary information for applying a Submodel template, while leaving deeper descriptions and specification of concepts, structures and mapping to the respective documents [1-6].

The target group of the specification are developers and editors of technical documentation and manufacturer information, which are describing assets in smart manufacturing by means of the Asset Administration Shell (AAS) and therefore need to create a Submodel instance with a hierarchy of SubmodelElements. This document especially details on the question, which SubmodelElements with which semantic identification shall be used for this purpose.

1.2 Scope of the Submodel

This Submodel template aims at interoperable provision of information describing a purchase request response from a supplier to a customer / buyer in regard to the asset of the respective Asset Administration Shell. Central element is the provision of properties [7], ideally interoperable by the means of dictionaries such as ECLASS and IEC CDD (Common Data Dictionary). The purpose of this document is to make selected specifications of Submodels in such manner that information about assets can be exchanged in a meaningful way between partners in a value creation network. It targets purchase order processes and the information involved in such processes.

The intended use-case is the provision of a standardized property structure for quotations, which enables the standardized provision of information in the context of a purchase order and data exchange which production planning.

This concept can serve as a basis for standardizing the respective Submodel. The conception is based on existing norms, studies of common practices at enterprises, directives and standards so that a far-reaching acceptance can be achieved.

Beside standardized Submodel this template also introduces standardized SubmodelElementCollections (SMC) in order to improve the interoperability while modelling aspects of purchase order relevant topics within other Submodels.

The Asset Administration Shell (AAS) is to be used to map the information of a purchase order processes. This comprises in particular B2B transactions (business-to-business) in which companies purchase production components and resources for more complex assemblies and products within the value chain.

For this purpose, the purchase request, response and order creation of an interested party is standardized to enable orders of articles, materials or services from one or more supplier(s) via a structured format, also taking into account variants.

A transferability of the Submodel to the B2C business (business-to-customer), in which the end customer orders a product, is additionally considered.

Crucial to the seamless processing of the order process is the consideration and provision of item lists (BOM: Bill of Material) for the requested product, but also the necessary production equipment to carry out the subsequent order in the form of a work plan.

If different variants of a supplier product are requested by the client, the effort involved in the feasibility test increases accordingly. The dependency on other manufacturing processes, e.g. via co-products (by-products that can be used by or for other products) increase the complexity.

Once the feasibility has been checked, the costs associated with the order, such as personnel costs and current material/raw material prices can be considered.

Conversely, the buyers / customers, i.e. OEM face the challenge of requesting and ordering the production of sub-components or parts of their products from a large number of different suppliers.

In general, the process can be described as the generation of a purchase order request by the client, the processing and feedback from the supplier with a specific quotation and the confirmation of the quotation by the buyer (order). Often, several rounds of coordination between the client and the supplier are necessary. The time required for both clients and suppliers is correspondingly high, especially since different ERP systems can be used and the procedures for processing order processes differ from company to company.

The standardization is intended to create a possibility for automating the purchase ordering process, particularly the feasibility check in production planning. In addition to technical features, time-related features such as availability of production machines and personnel as well as monetary features such as production and raw material costs can to be taken into account for the calculation of the price.

If the a purchase request of a buyer, e.g. an original equipment manufacturer (OEM), refers to a product which is not available out-of-shelf, manual feasibility checks have to be performed by production planners, which can be very time consuming and error-prone in non-standardized processes, especially if several variants are requested.

In order to enable an efficient, less error-prone processing of purchase orders, the information about the order and description of items which are subject of the order should be represented in the Asset Administration Shell (AAS). This allows to use technical data and capability descriptions from the digital twins of the items. In addition, this also creates opportunities for automation of feasibility checks in production planning.

The implementation is divided into three sub-areas (AAS Submodels):

- Purchase Request Notification,
- Purchase Request Response from the supplier with a concrete offer and
- Purchase Order Creation

In this document the Submodel **Purchase Request Response** is specified.

Use case example

Typical application

An automobile manufacturer (client) would like to have a interior panel made of plastic on the dashboard manufactured by a supplier (supplier) for a new vehicle model. There are several color and material variants for the interior trim, but also shape variants depending on the additional equipment of the vehicle, e.g. cutouts for controls. The client's design department (designer) provides various CAD drawings via a link in the article's administration shell.

In a purchase request from the purchasing department of the client (buyer), the information about the administration shell is sent via the ERP system to a selection of possible suppliers as a purchase request notification. The suppliers can automatically transfer the information from this into the offer template provided via the Submodel Purchase Request Response. The production planning department (production planner) of the supplier checks the feasibility of the request with regard to technical features, resource availability and scheduling, e.g. via suitable checklists or comparisons of features available through technical descriptions in the AAS items and creates the required production orders in the sub-model by selecting the necessary and available resources. According to the production orders, the prices and time capacities for the supplier's internal resources are determined and the corresponding information on the externally sourced resources is requested. A corresponding price for the offer is calculated from the individual prices for the resources. If the feasibility is met, the offer configured in the Submodel Purchase Request Response will be supplemented by the supplier with regard to the offer price and, if necessary, additional descriptions and sent back to the client.

The client checks the offer and, if necessary, coordinates it with the supplier. The client sends the supplier who wins the contract a purchase order via the Purchase Order Creation Submodel, into which the necessary information from the Submodels Purchase Request Notification and Purchase Request Response might be automatically transferred.

In principle, suppliers could also use the same Submodels concept to request their externally sourced resources (materials/raw materials).

Demonstrational use case example

As a demonstrational use case example the purchasing process of a rotary lobe pump is used to show the capabilities and usage of the Submodel. In this simple purchasing order a buyer, and a seller is involved. The pump is to be delivered to another address (production department) as the buyer address (purchasing department). The order consists of one item (the rotary lobe pump) and demonstrates a use case for ordering a product from a product catalogue.

1.3 Relevant standards and sources of concepts for the Submodel template

According to [3], interoperable properties might be defined by standards, consortium specifications or manufacturer specifications. Useful standards providing sources of concepts are:

Table 1: List of exemplary standards defining interoperable properties

VDA 4901	Basic concepts for data exchange in the supply chain V1.0 2019-12, German Association of the Automotive Industry (VDA) [8]
UN/EDIFACT	United Nations rules for Electronic Data Interchange for Administration, Commerce and Transport comprise a set of internationally agreed standards, directives, and guidelines for the electronic interchange of structured data, between independent computerized information systems [9]
openTRANS®	The openTRANS® format was developed with the aim of providing uniform electronic documents for intercompany e-commerce. Version 2.1, Fraunhofer IAO [10]
cXML Ariba	Commerce eXtensible Markup Language for transmitting data in eCommerce, Ariba Inc. [11]
SAP 4/HANA	ERP cloud solution by SAP AG, Walldorf [12]
IDTA Submodel Generic Frame for Technical Data for Industrial Equipment in Manufacturing	This Submodel template aims at interoperable provision of technical data describing the asset of the respective Asset Administration Shell [13]
IDTA Submodel Capability	Submodel to express capability definitions of a production resource, allowing to connect capability definitions and their properties from ontologies/catalogues to executable skills and their parameters [14]

So called property dictionaries are used to identify information elements (see Terms and Definitions of [6]). Such property dictionaries include:

- ECLASS, see: <https://www.eclasscontent.com/>
- IEC CDD, see: <https://cdd.iec.ch/cdd/iec61987/iec61987.nsf> and <https://cdd.iec.ch/cdd/iec62683/cdddev.nsf>

In this document, properties are aimed to be described by ECLASS.

2 Information set for Submodel Purchase Request Response

For the definition of the Submodel Purchase Request Response the following aspects considered as suggested in [5]:

Use and economic relevance

Purchase orders are the basis of almost all business processes, either for ordering a product, item, raw materials or services. The purchase order process is a fundamental component of efficient and accountable business operations. It contributes to cost control, accurate record-keeping, supplier relationships, and overall financial health, making it economically relevant for businesses of all sizes and industries. Because demand for products is the starting point for purchase orders and thus the production of goods, they play a crucial role in the value chain.

There are different standard formats for digital purchase order processing, e.g. UN/EDIFACT, openTRANS, cXmIAriba or the SAP 4/HANA API. The Purchase-Submodels close the gap from those data formats to Industry 4.0 standards and support interoperability between these standards and the AAS of the items (assets) which are the subject of the purchase orders.

Additionally, by developing AAS-Submodels containing the information of purchase orders in the language of Industry 4.0, compatible with the semantic descriptions of technical data and capabilities provided by Submodels already used in this context, helps to bridge the gaps between business processes and manufacturing environment. This essentially supports automation of related processes, e.g. to carry out feasibility checks for manufacturing the requested items.

In Figure 1 an overview on the overall purchase order and fulfillment process is shown. The scope of the three Submodels Purchase Request Notification, Purchase Request Response and Purchase Order Creation is highlighted in blue, and comprised the request for quotation, the quotation and the purchase order itself. Shipment and delivery, receipt confirmation or reports on damage and loss as well as invoicing is not depicted in these Submodels. However, relevant information regarding these downstream processes which have to be defined during the order process are considered in the Submodels, like shipping parties, delivery locations, payment methods, delivery dates and restrictions or incoterms.

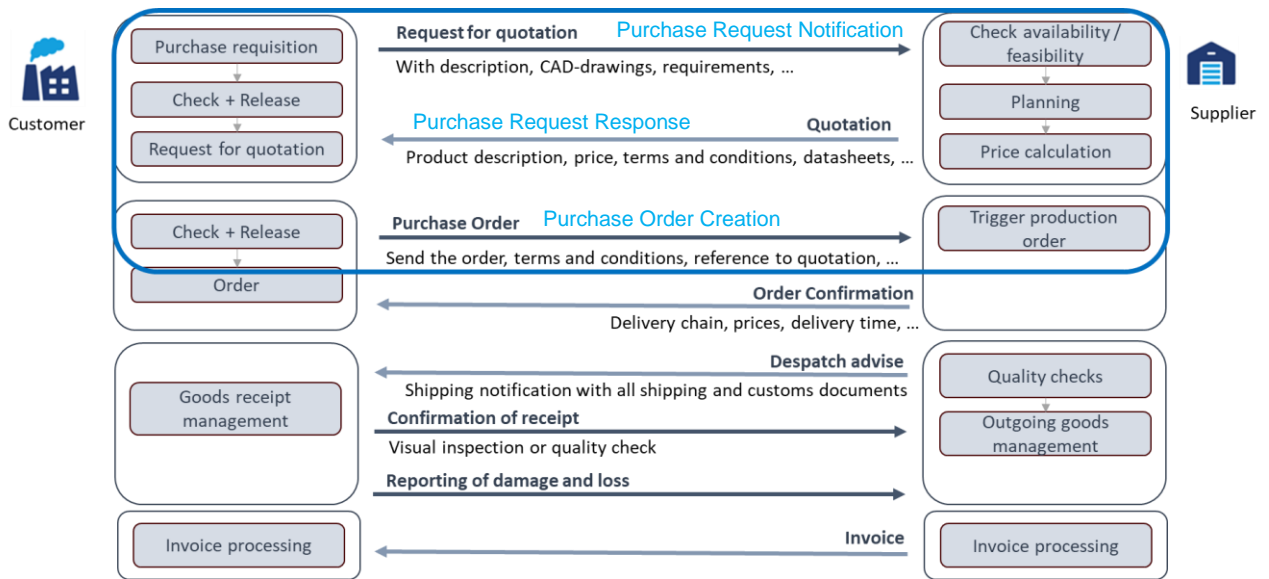

Figure 1: Overview on purchase order process and fulfillment. The scope of the three Submodels Purchase Request Notification, Purchase Request Response and Purchase Order Creation is highlighted in blue.

Possible functions and interactions

Figure 2 shows an overview on the interaction of the three Submodels in the context of the customer (buyer) and one or more suppliers.

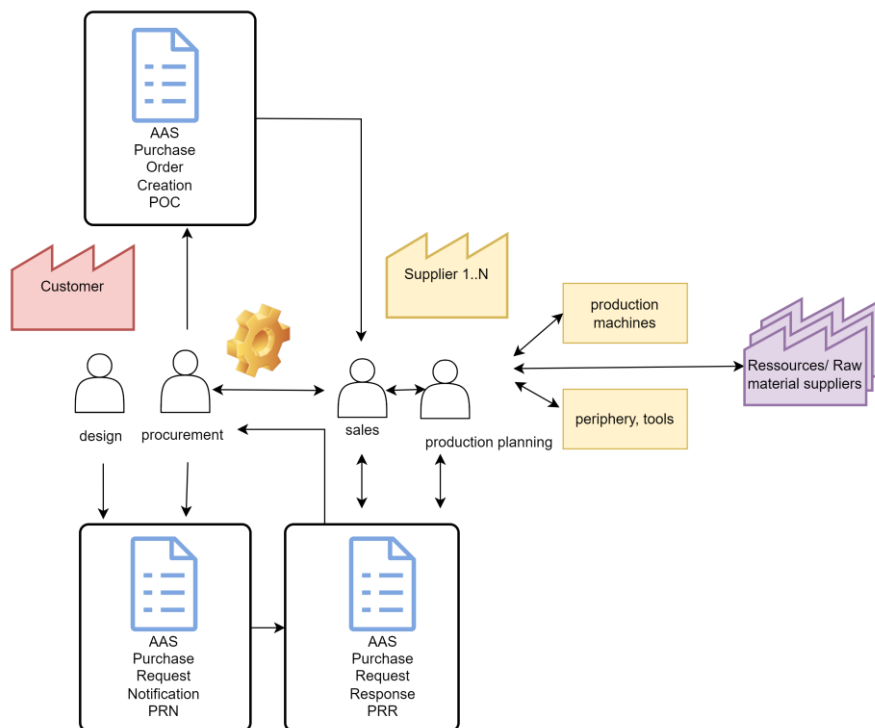

Figure 2: Overview on the interactions of the Submodel Purchase Request notification with Submodels Purchase Request Response and Purchase Order Creation.

Generally speaking a customer / buyer may send out a purchase request notification (request for quotation) to one or more suppliers, or even may place this request on a digital platform.

The supplier(s) use the information in the purchase request notification to check the availability, perform feasibility checks, regarding manufacturing equipment, material, personnel and timely resources, make price calculations and create the purchase request response (quotation). The purchase request response is sent it back or make it available to the customer / buyer. The customer checks the response, negotiate the conditions and finalizes the order by creating and sending a purchase order.

It is important to note that there might many several versions of requests, quotations, and purchases orders. Also, in quotations several requests might be combined, and/or in a purchase order several quotations might be summarized.

With respect to different situations regarding the type and availability of requested items three different scenarios are considered:

Scenario 1: Out-of-shelf products (e.g. products listed in an electronic product catalog). The request process for this scenario is described in Figure 3.

Scenario 2: Uncertainty if an existing product fits the specific requirements defined by the customer (e.g. a pump with specific performance, dimensions and flow-rate). The request process for this scenario is described in Figure 4.

Scenario 3: individual or not existing products, which have to be designed first and produced when the order is confirmed (e.g. headlights for a new car model). The request process for this scenario is described in Figure 5.

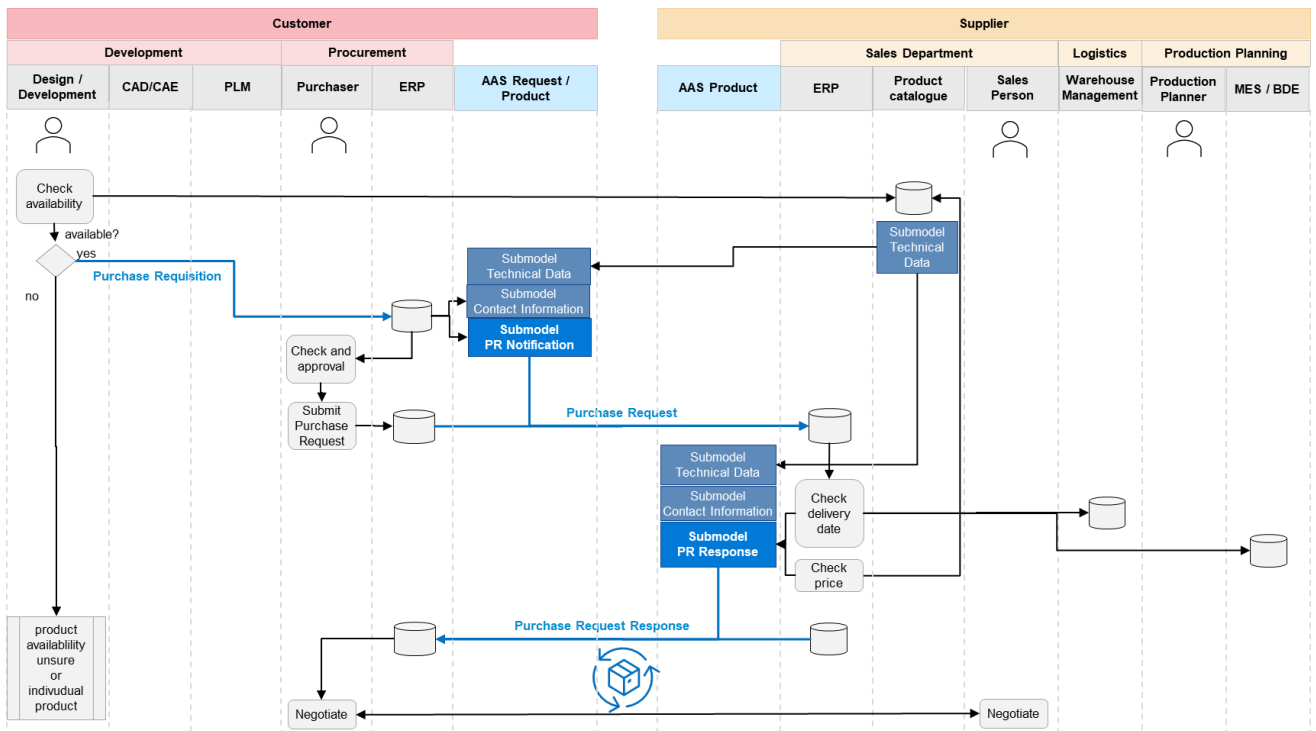

Figure 3: Process of ordering an out-of-shelf product (Scenario 1)

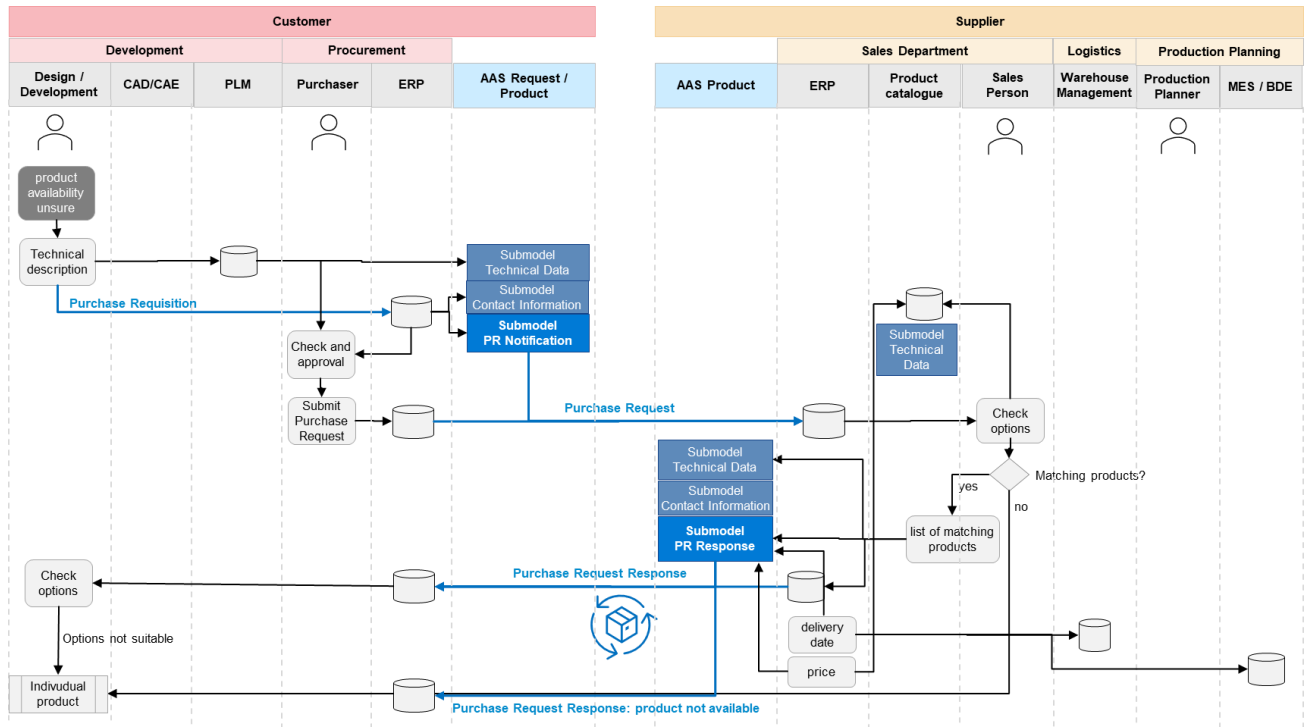

Figure 4: Purchase request process, if it is unsure whether an existing product fits the request or not. (Scenario 2)

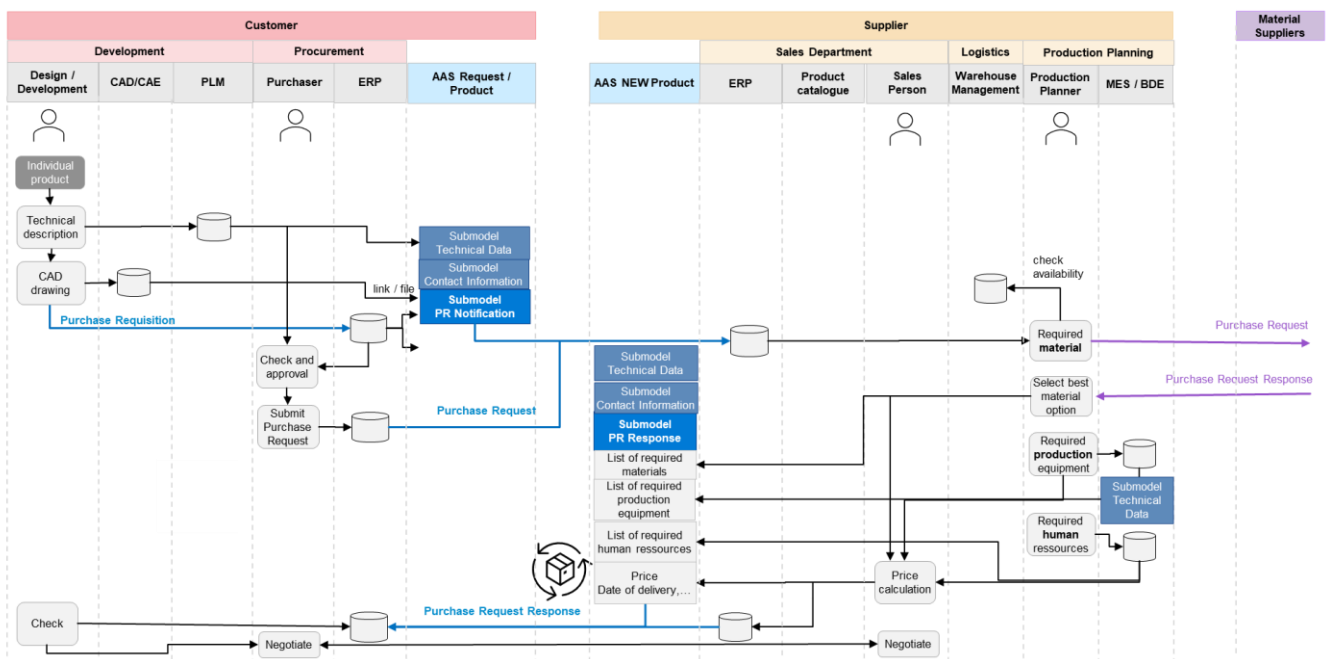

Figure 5: Purchase request process for individual / not existing products (Scenario 3)

The process of checking the purchase request response and creating the purchase order by the customer is the same for all these scenarios and described in Figure 6.

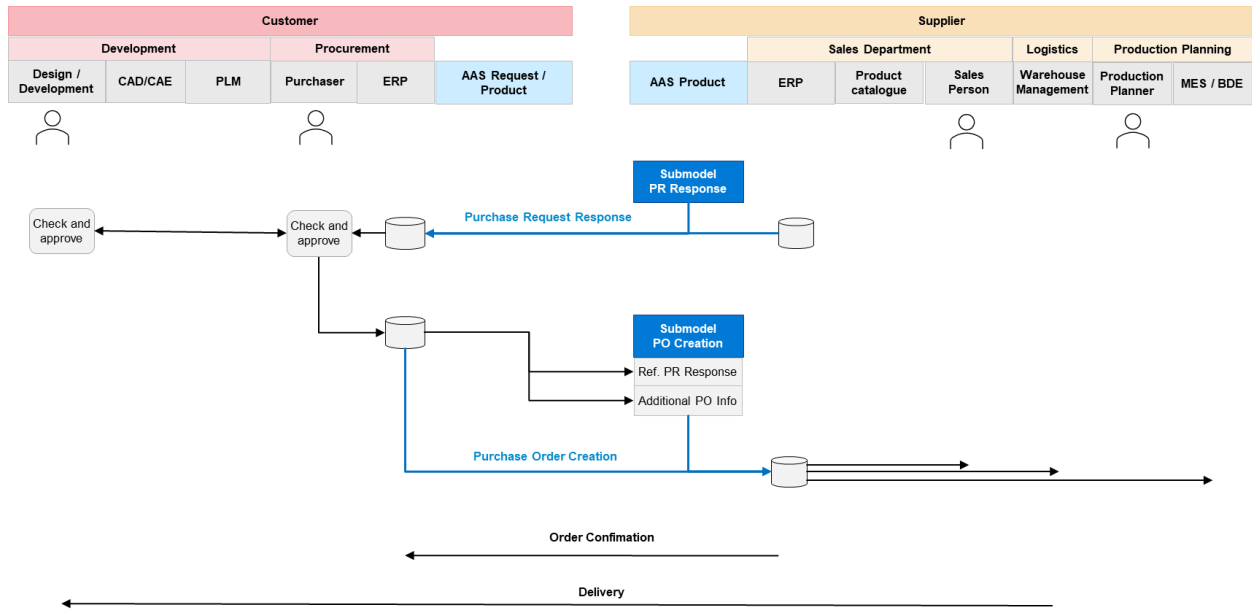

Figure 6: Process of the purchase order according based on the purchase request response (quotation)

The Submodel **Purchase Request Response** consists of the following main Submodel Element Collections (SMC) to separate the diverse relevant information in a structured manner:

Request Response Information

The SMC RequestResponseInformation is the header of the Purchase Request Response containing relevant information on the quotation itself, like quotation and request numbers specific to buyer, seller or agent; quotation date and version, open and close dates, language and currency settings, terms and conditions, overall descriptions and remarks.

Delivery dates can be provided in the SMC RequestResponseInformation directly if they apply for the complete order and are not assigned item specific.

Following other thematic information can be referenced in the header (SMC RequestResponseInformation) if they apply to the whole order: catalogs, Incoterms, business parties, international restrictions, special treatment classes, attached media (e.g. files, documents). These information are thematically organized in lists of SMCs which comprise a multitude of properties regarding each of the topics. These SMC can be also referenced for each item (QuotelItemList see below) separately, if necessary.

Catalog References

In the SMC CatalogReferenceList via SMC CatalogReference one or more references to digital product catalogs can be defined.

Modes of Payment

Within the List SMC ModeOfPaymentList several modes of payment can be defined, e.g. bank account, credit card, central payment regulations, etc.

Incoterms

The SMC IncotermsList may hold information on incoterm conditions which apply for the whole order or each item separately. Each condition is defined via SMC Incoterms and referred to in the specific item or in the header.

International Restrictions

If international restrictions apply (bans or embargos) they can be defined in the SMC InternationalRestriction as sub SMCs of SMC InternationalRestrictionList.

Certifications

Several certifications which might be required (e.g. CE, FDA, ...) can be defined in the SMC CertificationList, and SMC Certification respectively.

Special Treatment Classes

A list of necessary treatments during delivery can be defined in SMC SpecialTreatmentClasses using the property SpecialTreatmentClass

Involved Parties

Within the SMC InvolvedPartiesList all business parties involved in the order and fulfillment process can be described using the SMC Party. This SMC comprises properties for the role of the party (e.g. buyer, supplier, manufacturer, agent, carrier,...), reference ids, contact information (as a reference to IDTA Submodel ContactDetails). Because the address of the party (e.g. delivery address) might differ from the address of the contact person, the address of the party is additionally defined (SMC Address).

Cost Centers

In the SMC CostCentersList via the sub-SMC CostCenter, cost centers can be defined by the buyers, holding information on cost center code and name, reason code and name, carrier code and name, project number and name, billing center code and name.

Attached Media

If media files or documents shall be attached to the purchase request response they can be listed in the SMC AttachedMediaList and its sub-SMC Media, containing the file, mime type, mime purpose and a comment, describing the file.

Quote Items

The items which are subject of the purchase request response (quotation) are described in the SMC QuoteItem. This SMC comprises properties to provide information on ids of the item, parent items, type and classification of the item (material, wages, transport, service), stock status, order quantities, content quantity, number of content units per order unit, content quantity in content units, corresponding units, prices, agreements and terms, remarks, delivery requirements.

As mentioned above for each item specific references to catalogs, incoterms, business parties, international restrictions, special treatment classes, attached media can be provided separately.

Also, delivery dates can be provided for each item separately, if necessary, using the SMC DeliveryDateList.

Information on carbon footprint can be provided for each item in the SCM CarbonFootprint, with respect to the material used, the delivery process and the product itself.

Different definitions of a product id can be provided in the SMC ProductID, e.g. GTIN, UPC or product ids specific to supplier, buyer, agent, deliverer, manufacturer. Also the material number in an SAP ERP system might be provided here.

Additionally scan codes for the item can be defined in the SAM ScanCodeList providing the code type and code itself.

Ingredients which have are not allowed in the item, e.g. CFC, might be listed in the SMC ExcludedIngredientsList.

Besides the mentioned conditions and definitions of the item, a product name, short and long text descriptions for the item can be provided.

The description of technical properties and data (Submodel Generic Frame for Technical Data for Industrial Equipment in Manufacturing or a specific Technical Data Submodel [13]) and/or capabilities (Submodel Capability [14]) can be provided by referencing to an AAS of an existing item or an AAS of an item that does not yet exist.

Property specification

See section 3 Submodel and Collections on the following pages.

3 Submodel and Collections

3.1 Properties of the Submodel "Purchase Request Response"

The figure below shows the UML-diagram defining the relevant properties which need to be set. Table 2 describes the details of the Submodel structure combined with examples.

The Submodel **Purchase Request Response** describes a purchase request that leads to a request message in a standardized form.

4 Usage as SubmodelElementCollection

4.1 Properties of the Submodel “PurchaseRequestResponse”

Due to the fact that Submodel PurchaseRequestResponse can be re-used in various contexts, the specified SMCs in section 3 can be used within other Submodels. In this way the parent Submodel can utilize standardized means of purchasing topics.

Annex A: Explanations on used table formats

General

The used tables in this document try to outline information as concise as possible. They do not convey all information on Submodels and SubmodelElements. For this purpose, the definitive definitions are given by a separate file in form of an AASX file of the Submodel template and its elements.

Tables on Submodels and SubmodelElements

For clarity and brevity, a set of rules is used for the tables for describing Submodels and SubmodelElements.

- The tables follow in principle the same conventions as in [5].
- The table heads abbreviate 'cardinality' with 'card'.
- The tables often place two informations in different rows of the same table cell. In this case, the first information is marked out by sharp brackets [] from the second information. A special case are the semanticIds, which are marked out by the format: (type)(local)[idType]value.
- The types of SubmodelElements are abbreviated: SME

SME type Submodel	Element type
Property	Property
MLP	MultiLanguageProperty
Range	Range
File	File
Blob	Blob
Ref	ReferenceElement
Rel	RelationshipElement
SMC	SubmodelElementCollection

- If an idShort ends with '{00}', this indicates a suffix of the respective length (here: 2) of decimal digits, in order to make the idShort unique. A different idShort might be chosen, as long as it is unique in the parent's context.
- The Keys of semanticId in the main section feature only idType and value, such as: [IRI]https://admin-shell.io/vdi/2770/1/0/DocumentId/Id. The attributes "type" and "local" (typically "ConceptDescription" and "(local)" or "GlobalReference" and "(no-local)") need to be set accordingly; see [6].
- If a table does not contain a column with "parent" heading, all represented attributes share the same parent. This parent is denoted in the head of the table.
- Multi-language strings are represented by the text value, followed by '@'-character and the ISO 639 language code: example@de.
- The [valueType] is only given for Properties.
